

Chum tube lure

Abstract

A chum tube lure for catching fish by spreading fish oil attractant out the back of a chum tube and over the lure. Fish oil attractant is inserted into the head of the chum tube. Inside the tube is a manila rope used to absorb the fish oil and control the process of spreading the fish oil out and over the lure. As the chum tube lure is trolled water flows through the head at the front of the chum tube forcing fish oil out the back of the chum tube over the lure. The chum tube lures such as a chum tube eel is a tube eel attached to the back section of the chum tube. The chum tube eel or lure is spinning creating noise and vibrations in the water. This accompanied by the fish oil attractant flowing over the lure helps to attract fish to the lure.
